Multiclass Fundamentals

## Text Classification

### A Cancer Conundrum: Too Many Drug Trials, Too Few Patients

Breakthroughs in immunotherapy and a rush to develop profitable new treatments have brought a crush of clinical trials scrambling for patients.

By GINA KOLATA

### Yankees and Mets Are on Opposite Tracks This Subway Series

As they meet for a four-game series, the Yankees are playing for a postseason spot, and the most the Mets can hope for is to play spoiler.

# **Reading Comprehension**

One day, James thought he would go into town and see what kind of trouble he could get into. He went to the grocery store and pulled all the pudding off the shelves and ate two jars. Then he walked to the fast food restaurant and ordered 15 bags of fries. He didn't pay, and instead headed home.

3) Where did James go after he went to the grocery store?

- A) his deck
- B) his freezer

C) a fast food restaurant

D) his room

### Multiple choice questions, 4 classes (but classes change per example)

Richardson (2013)

# Binary Classification

 Binary classification: one weight v classes

### Binary classification: one weight vector defines positive and negative

Can we just use binary classifiers here?

2

3

One-vs-all: train k classifiers, one to distinguish each class from all the rest

One-vs-all: train k classifiers, one to distinguish each class from all the rest

One-vs-all: train k classifiers, one to distinguish each class from all the rest

- How do we reconcile multiple positive predictions? Highest score?

One-vs-all: train k classifiers, one to distinguish each class from all the rest

Not all classes may even be separable using this approach

Not all classes may even be separable using this approach

Not all classes may even be separable using this approach

Not all classes may even be separable using this approach

Can separate 1 from 2+3 and 2 from 1+3 but not 3 from the others (with these features)

All-vs-all: train n(n-1)/2 classifiers to differentiate each pair of classes

All-vs-all: train n(n-1)/2 classifiers to differentiate each pair of classes

All-vs-all: train n(n-1)/2 classifiers to differentiate each pair of classes

- All-vs-all: train n(n-1)/2 classifiers to differentiate each pair of classes
- Again, how to reconcile?

Binary classification: one weight vector defines both classes

Binary classification: one weight vector defines both classes

### Multiclass Classification

Multiclass classification: different weights and/or features per class

Binary classification: one weight vector defines both classes

### Multiclass Classification

Multiclass classification: different weights and/or features per class

- a number of possible classes
  - spaces, including sequences and trees

Formally: instead of two labels, we have an output space  $\gamma$  containing

Same machinery that we'll use later for exponentially large output

- a number of possible classes
  - spaces, including sequences and trees
- Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$

Formally: instead of two labels, we have an output space  $\gamma$  containing

Same machinery that we'll use later for exponentially large output

- a number of possible classes
  - spaces, including sequences and trees
- Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$

Formally: instead of two labels, we have an output space  $\gamma$  containing

Same machinery that we'll use later for exponentially large output

features depend on choice of label now! note: this isn't the gold label

- a number of possible classes
  - spaces, including sequences and trees
- Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 
  - Multiple feature vectors, one weight vector

Formally: instead of two labels, we have an output space  $\gamma$  containing

Same machinery that we'll use later for exponentially large output

features depend on choice of label now! note: this isn't the gold label

- a number of possible classes
  - Same machinery that we'll use later for exponentially large output spaces, including sequences and trees
- Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 
  - Multiple feature vectors, one weight vector

Formally: instead of two labels, we have an output space  $\gamma$  containing

features depend on choice of label now! note: this isn't the gold label

• Can also have one weight vector per class:  $\operatorname{argmax}_{u \in \mathcal{V}} w_u^{+} f(x)$ 

- a number of possible classes
  - Same machinery that we'll use later for exponentially large output spaces, including sequences and trees
- Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 
  - Multiple feature vectors, one weight vector
  - Can also have one weight vector per class:  $\operatorname{argmax}_{u \in \mathcal{V}} w_u^{+} f(x)$
  - The single weight vector approach will generalize to structured output spaces, whereas per-class weight vectors won't

### Multiclass Classification

Formally: instead of two labels, we have an output space  $\gamma$  containing

features depend on choice of label now! note: this isn't the gold label

### Feature Extraction

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

too many drug trials, too few patients

Base feature function:

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

- Base feature function:
  - f(x) = I[contains drug], I[contains patients], I[contains baseball]

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

#### too many drug trials, too few patients

- Base feature function:

### f(x) = I[contains drug], I[contains patients], I[contains baseball] = [1, 1, 0]

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

too many drug trials, too few patients

- Base feature function:

f(x, y = Health) =

### f(x) = I[contains drug], I[contains patients], I[contains baseball] = [1, 1, 0]

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

#### too many drug trials, too few patients

- Base feature function:

f(x, y = Health) = [1, 1, 0, 0, 0, 0, 0, 0, 0]

### f(x) = I[contains drug], I[contains patients], I[contains baseball] = [1, 1, 0]

• Decision rule:  $\operatorname{argmax}_{u \in \mathcal{Y}} w^{\top} f(x, y)$ 

#### too many drug trials, too few patients

- Base feature function:
  - f(x, y = Health) = [1, 1, 0, 0, 0, 0, 0, 0, 0]

f(x) = I[contains drug], I[contains patients], I[contains baseball] = [1, 1, 0]feature vector blocks for each label

• Decision rule:  $\operatorname{argmax}_{u \in \mathcal{Y}} w^{\top} f(x, y)$ 

### too many drug trials, too few patients

- Base feature function:

  - f(x, y = Health) = [1, 1, 0, 0, 0, 0, 0, 0, 0]f(x, y = Sports) = [0, 0, 0, 1, 1, 0, 0, 0, 0]

f(x) = I[contains drug], I[contains patients], I[contains baseball] = [1, 1, 0]feature vector blocks for each label

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

### too many drug trials, too few patients

- Base feature function:

  - f(x, y = Health) = [1, 1, 0, 0, 0, 0, 0, 0, 0]
  - f(x, y = Sports) = [0, 0, 0, 1, 1, 0, 0, 0, 0]

f(x) = I[contains drug], I[contains patients], I[contains baseball] = [1, 1, 0]feature vector blocks for each label

• Decision rule:  $\operatorname{argmax}_{y \in \mathcal{Y}} w^{\top} f(x, y)$ 

### too many drug trials, too few patients

- Base feature function:

  - f(x, y = Health) = [1, 1, 0, 0, 0, 0, 0, 0, 0]
  - f(x, y = Sports) = [0, 0, 0, 1, 1, 0, 0, 0, 0]
- Equivalent to having three weight vectors in this case

f(x) = I[contains drug], I[contains patients], I[contains baseball] = [1, 1, 0]feature vector blocks for each label

I[contains drug & label = Health]

$$f(x) = I[\text{contains } drug], I[\text{contains } path f(x, y = \text{Health}) = [1, 1, 0, 0, 0, 0, 0, 0]$$
  
 $f(x, y = \text{Sports}) = [0, 0, 0, 1, 1, 0, 0]$ 

#### too many drug trials, too few patients

+1.1, -1.7, -1.3]

$$\begin{split} f(x) &= \mathsf{I}[\mathsf{contains}\ drug], \mathsf{I}[\mathsf{contains}\ pat] \\ f(x,y &= \mathsf{Health}\ ) = \begin{bmatrix} \mathsf{I}, \mathsf{1}, \mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}, \mathsf{0}, [\mathsf{0}, \mathsf{0}, \mathsf{0}$$

$$\begin{split} f(x) &= \mathsf{I}[\mathsf{contains}\ drug], \mathsf{I}[\mathsf{contains}\ path ] \\ f(x,y) &= \mathsf{Health} \ ) = \begin{bmatrix} \mathsf{I}, \mathsf{1}, \mathsf{0}, \mathsf{0}$$

blocks

the router blocks the packets

### the router [blocks] the packets NNS **VBZ** NN DT

Classify blocks as one of 36 POS tags

- Classify blocks as one of 36 POS tags
- Example x: sentence with a word (in this case, blocks) highlighted

- Classify blocks as one of 36 POS tags
- Example x: sentence with a word (in this case, blocks) highlighted
- Extract features with respect to this word:

- Classify blocks as one of 36 POS tags
- Example x: sentence with a word (in this case, blocks) highlighted
- Extract features with respect to this word:
   f(x, y=VBZ) = I[curr\_word=blocks & tag = VBZ], I[prev\_word=router & tag = VBZ]
   I[next\_word=the & tag = VBZ]
   I[curr\_suffix=s & tag = VBZ]

- Classify blocks as one of 36 POS tags
- Example x: sentence with a word (in this case, blocks) highlighted
- Extract features with respect to this word:
  f(x, y=VBZ) = I[curr\_word=blocks & tag = VBZ],
  I[prev\_word=router & tag = VBZ]
  I[next\_word=the & tag = VBZ]
  I[curr\_suffix=s & tag = VBZ]

Compare to binary:

$$\overline{y')}$$
  $P(y = 1|x) = \frac{\exp(w^{\top}f(x))}{1 + \exp(w^{\top}f(x))}$ 

negative class implicitly had f(x, y=0) = the zero vector

 grad_squared += dx * dx
 x -= learning_rate * dx / (np.sqrt(grad_squared) + 1e-7)
```

### Per-parameter learning rate: smaller updates are made to parameters

- Optimized for problems with sparse features
- that get updated frequently

### Per-parameter learning rate: smaller updates are made to parameters

- Optimized for problems with sparse features
- that get updated frequently

$$w_i \leftarrow w_i + \alpha \frac{1}{\sqrt{\epsilon + \sum_{\tau=1}^t g_{\tau,i}^2}} g_{t_i}$$

Per-parameter learning rate: smaller updates are made to parameters

### (smoothed) sum of squared gradients from all updates

- Optimized for problems with sparse features
- that get updated frequently

$$w_i \leftarrow w_i + \alpha \frac{1}{\sqrt{\epsilon + \sum_{\tau=1}^t g_{\tau,i}^2}} g$$

Generally more robust than SGD, requires less tuning of learning rate

## AdaGrad

Per-parameter learning rate: smaller updates are made to parameters

### $t_i$ (smoothed) sum of squared gradients from all updates

- Optimized for problems with sparse features
- that get updated frequently

$$w_i \leftarrow w_i + \alpha \frac{1}{\sqrt{\epsilon + \sum_{\tau=1}^t g_{\tau,i}^2}} g$$

- Other techniques for optimizing deep models more later!

Per-parameter learning rate: smaller updates are made to parameters

### $t_i$ (smoothed) sum of squared gradients from all updates

Generally more robust than SGD, requires less tuning of learning rate

### Design tradeoffs need to reflect interactions:

- Design tradeoffs need to reflect interactions:
  - Model and objective are coupled: probabilistic model <-> maximize likelihood

- Design tradeoffs need to reflect interactions:
  - Model and objective are coupled: probabilistic model <-> maximize likelihood
  - ...but not always: a linear model or neural network can be trained to minimize any differentiable loss function

- Design tradeoffs need to reflect interactions:
  - Model and objective are coupled: probabilistic model <-> maximize likelihood
  - ...but not always: a linear model or neural network can be trained to minimize any differentiable loss function
  - Inference governs what learning: need to be able to compute expectations to use logistic regression
